

# Passive Monitor Schematic

This section unbalances the signal right from the start. It assumes the unit feeding it is happy to supply a positive or negative phase independantly of each other.

Otherwise it may be nessesary to have a more ellaborate switch to ground 2 or 3 alteratively.

Can be independant switches.

Mono switch is ganged, the centre section slams the left and right together. The outer sections linking the resistors are there to attenuate a little and to provide some ease for the output of the previous section which will now be seeing the other output as a load.

The Left/Right is also ganged and is a simple flip

Mute can be independant switches.

Passive Monitor Schematic for monitoring A simple DAW system.
